Description

This model is an adaptation of my first ESP8266 D1 Mini project with an 7 Segment Display. It has the appearance of an YouTube Play button and shows the Subscriber/Follower on YouTube or Printables. The display switches every 5 Minutes between Subscriber/Views and Follower/Downloads.

The original YouTube Play button I build, was set inside an old picture frame. I painted black it black and drilled holders for nails and inserted 3d printed picture frame holes. The ESP and the Display were glued in place

with a lot of hot glue. This was the reason for me to rebuild the original project with a nicer frame.

Making

The project uses a main frame a with back panel and a front panel. The front panel can be changed to the two different platforms either YouTube or Printables. I also used a paper backing between the front and back frame to hide the black segments from the 7 segment display. I cut a

normal piece of paper to size and glued it in place. The back and the front panel on mine didn't need any fixtures they held in place with a friction fit.

Components

- EPS8266 WEMOS D1 mini
- 7 Segment Display

Soldering

The soldering on this project is pretty easy you only have to connect 5 pins with 5 cm long cables. The location for the 7 segment display is close to that of the esp.

Programming

The programme is pretty simple. You have to adjust the appropriate settings for Printables/YouTube to get the correct data.

The Wi-Fi connection is handled by the WifiManager. When the board starts for the first time it will show up as a Wi-Fi hotspot. You should connect with it and can then put in your Wi-Fi credentials. After that the board will always connect to your registered Wifi.

Conclusion

The project was one of my first so it was pretty nice to finally get it to a proper finished state. It was a fast and easy project. I had all the parts lying around and could finish everything in two days.
